We not only have the best but the most

Over 300 Choice Varieties

Scientifically grown - Varmit Free

All plants sold F.O.B. Greenhouse

Best prices in Florida for comparative size

Open for sales April 1st.

Let's get to-gether.

BLOOM TYPES FOR NOMENCLATURE IDENTIFICATION

1. CARTWHEEL OVERLAP SINGLE
   Petals completely overlapped to tips, giving a regular, circular appearance. (Example-Ross Esty)

2. REGULAR SINGLE
   Petals separated for less than half the distance from edge, giving a regular, scalloped appearance to edge. Most singles fall into this type. (Example - Single Scarlet)

3. PINWHEEL SINGLE
   Petals narrow and separated for nearly their entire length. (Example - White Wings)

4. FRINGE SINGLE
   Edges of petals split and fringed. Staminal long and pendulous. This type includes H. Schizopetalus and it's hybrids. (Example - Rowena Wedding)

5. CRESTED SINGLE
   Basic type may be any of above, but normal bloom exhibits peraloids on end of staminal column forming a perfect crest. This does not include many varieties that may occasionally show a mal-formed crest. (Example - Nan Patterson)

6. CRESTED SEMI-DOUBLE
   Loose double appearance, with petaloids arising from staminal column. Stigma usually present. (Example - Mildred Rutter)

7. COLLARETTE (CUP & SAUCER)
   Outside guard petals follow single form. Center tuft of petaloids all arise from center and are distinctly separated from guard petals. (Example - Veronica)

(See page 22 for 8, 9, 10)
